Bernhard Beckert – Formal Verification of System Software

SVARM, 21.07.10

Avionics Application (Sysgo's PikeOS)

- L4-based, industrial, safety- and security-critical microkernel
- Flies in Airbus A350
- ca. 20,000 LOC (90% C, 10% assembler)

Challenges

- Complexity and size of kernel
- "Real" implementation in C + assembly
- Not implemented with verification in mind
- Concurrency (with preemption)

(iterative)

Bottom-up vs. top-down

- Bottom-up: start with individual functions
- Top-down: start with global requirement spec

We started bottom-up

- understand \rightarrow specify \rightarrow verify
 - helper functions
 - individual system calls
- first sequential, then concurrent

Result

Verification of functions / system calls possible with VCC

(both sequential and concurrent)

SVARM, 21.07.10

Handling Concurrency

Example: System Call p4_fast_set_prio

From the kernel reference manual

"This function sets the current thread's priority to newprio. Invalid or too high priorities are limited to the caller's task MCP. Upon success, a call to this function returns the current thread's priority before setting it to newprio."

Requirement vs. Auxiliary Specification

Annotations serve different purposes

Requirement specification: Express the properties to be verified

Auxiliary annotations: Provide knowledge about the program Support the verification process / finding a proof

Two kinds of auxiliary annotations

Needed for efficiency (lemmas):

Allows shorter and/or easier to find proofs
 Not needed for the existence of a proof

Essential: Needed for the existence of a proo loop invariants, assignable clauses

- Allows shorter and/or easier to find proofs
- Not needed for the existence of a proof

Essential: • *Needed* for the existence of a proof: loop invariants, assignable clauses, ...

Conclusions IV: The Bottle-Neck Now

Bottle-neck now:

Specification (methodologies, formalisms) for

useful low-level spec

adequate abstract model

(important for verification but also certification)

Verisoft I
